novaSOC Compliance Storage

novaSOC Device/Compliance data storage is a new offering to solve both highly regulated data holds for organizations and to allow partners to send custom non supported data types to novaSOC for storage. This product allows partners to upload device and/or compliance related data for long term storage. novaSOC Device/Compliance Storage can also be used to store and hold data that is already captured by novaSOC for compliance reasons as well. When selected the data is stored using a per month price and allows the MSP to decide what types of data to store and for what retention period to store the data for. Supported data types include firewall logs, long term storage of already consumed log storage, other customer application log types, and others.

How it works

Customers order via portal. We calculate storage monthly and provide a billing statement based on total consumed storage. Billing is calculated daily and rolled up at the end of the month based on actual usage.
